PROFESSIONAL OVERVIEW

Software Engineer on PhonePe's SRE Tools team, building distributed, cloud-native observability and bare-metal provisioning tooling used by Site Reliability Engineering to run PhonePe Cloud's microservices at scale. Proficient in Go, Python, and REST API design, with experience building PaaS/OaaS platforms, custom SDKs, and bare-metal orchestration across 25,000+ servers.

WORK EXPERIENCE

Software Engineer | SRE Tools, PhonePe – Bangalore, India

July 2025 – Present

- Scaled OBX, a centralized observability platform, across three production regions, establishing it as the standard telemetry and operational-monitoring service for PhonePe's major internal cloud applications, including PhonePe Cloud (PPEC), Identity RBAC, and Senzu.
- Drove ingestion of all telemetry – metrics, traces, and logs – from these services into OBX, unifying previously siloed monitoring data under a single platform.
- Reduced cross-component debugging and diagnostics time by 90% by enabling correlation of logs and traces across microservices using a shared trace ID for the entire request context, replacing fragmented per-service log and trace views.
- Implemented Gunicorn/uWSGI fork-safety for OpenTelemetry metrics using post-fork meter re-initialization hooks and PID drift detection at the SDK level, solving the issue of metrics being dead post-fork.
- Implemented authorization controls (RBAC) in OBX to enforce team-level access boundaries, isolating telemetry data ownership across teams.
- Became the primary point of contact for the bare-metal provisioning orchestration platform (PPEC), managing firmware across approximately 25,000 bare-metal servers in PhonePe's on-prem data centers.
- Redesigned PPEC's firmware upload flow, cutting bare-metal firmware upgrade time from days to minutes.
- Shipped all OBX and PPEC feature releases to production through GitLab CI/CD pipelines, the team's standard post-development deployment path.

Software Developer Intern | PhonePe – Bangalore, India

January 2025 – June 2025

- Architected OBX from scratch as a 5-layer Observability-as-a-Service platform to achieve complete API observability across all three telemetry pillars.
- Built a zero-code instrumentation SDK on top of OpenTelemetry, enabling services to onboard to production-grade metrics, traces, and logs in minutes; reduced manual instrumentation effort by 85%.
- Wrote a Go-based Nginx access log tailer exposing proxy-level request drops, providing visibility that application-level APIs could not capture.
- Implemented upstream/downstream service dependency graphs with live load percentages via OpenTelemetry request hooks, surfacing call-chain structure across microservices.
- Automated Grafana dashboard generation on service registration and implemented SSO for Grafana, eliminating manual dashboard setup and repeated logins.

PERSONAL PROJECTS

Placement Cell Website (Hackathon Project)

- Leveraged React, Redux, Material UI, Node, Express, MongoDB, JWT, and NodeMailer to build a full-stack application.
- Reduced job application submission time by 50% through single-click applications, streamlining the process for users.
- Boosted user engagement by 30% by integrating real-time email notifications for new job postings.
- Added a chatbot powered by Gemini responsible for helping with placement-related queries.

EDUCATION

Bangalore Institute of Technology, B.E. in Computer Science – CGPA: 8.75/10

Graduated: 2025

ACHIEVEMENTS

- Competitive Programming: CodeChef 3-star (max rating 1740, Global Rank 19 in Starter 113 out of 25,000+). LeetCode top 11% (max rating 1777, 700+ problems solved).

TECHNICAL SKILLS

Languages & Frameworks: Go, Python, C, C++, HTML, CSS, JavaScript, SQL, ReactJS, NodeJS, FastAPI, TailwindCSS, Shadcn

Databases: MySQL, MariaDB, SQLite, MongoDB, Elasticsearch

Observability & Monitoring: OpenTelemetry (OTel Collector), Prometheus, Grafana, Loki, Jaeger, Kibana

DevOps & Infrastructure: Docker, Podman, Kubernetes, GitLab CI/CD, Nginx, Linux, Git, Redfish API, Azure Container Apps

Concepts: Site Reliability Engineering (SRE), Distributed Systems, Microservices, Cloud-Native Architecture, Bare Metal Provisioning, RBAC (Authorization), Diagnostics, gRPC, REST APIs, Redis, Dify (GenAI/LLMOps)
